Stellarphoenixoutlookpstrepairv45serialkeytorrentzip

I've tried the Repair option but it didn't work. For reference, I'm using the following version of Windows 7: [OS]: Microsoft Windows [Version 6.1.7601 Service Pack 1 Build 7601] [64

bit] [Time]: 7/1/2018, 9:31:12 PM
[CPU Model]: Intel(R) Core(TM)
i7-7500U CPU @ 2.50GHz

[Number of Cores]: 4 [Number of
Logical Processors]: 2 [Number
of Physical Processors]: 4 A: I

eventually found an official
solution to this problem, posted
as an answer to the original
question on Super User. I've
updated this answer with the
official solution as well as the
steps needed to apply the fix.

Solution Go to Settings | Ease of
Access | Display | Advanced
Features (this was the key. I first
looked in the Windows option
and didn't find it there) Click the

Display button Click on the Advanced Features Settings Turn on the "Visual Effects" checkbox, which can be found in the second list on the right side Then, Click on the "Overclock Settings" tab Change the settings in the "Visual Effects" list to "On" Note: This seems to cause the CPU to use more resources than the original option, but I suspect this is due to me accidentally turning them on instead of off. I will give it a few days to figure out what the impact is going to be on my computer, but as of now, the changes have been invisible. If

that doesn't work, or if any conflicts arise, you can simply disable and re-enable the option.

Potential Solutions Another solution is to use an add-on called BetterTouch Tool, that improves the touch screen features of Windows. This was originally developed to help with accessibility for people with physical disabilities, but it works well for other purposes as well.

Steps Download and install the BetterTouchTool from the website. In the Start Menu, search for it in the Start Menu. Once it has been installed, the next time you open the program,
